## ABSTRACT OF THE DISCLOSURE

The luminance of phosphor is enhanced by forming a phosphor screen of a fluorescence generation unit by phosphor expressed by the following composition formula and a display using a white light the luminescent color of which is improved and which has an excellent characteristic is acquired.

Composition formula:  $(L_{1-a-b}Gd_aCe_b)_3$  (Al<sub>1-c</sub>Ga<sub>c</sub>)<sub>5</sub>O<sub>12</sub>:M<sub>d</sub> wheein, a, b and c are in each range of 0  $\leq$  a  $\leq$  1.0, 0 < b  $\leq$  0.1 and 0  $\leq$  c  $\leq$  1.0, M is dopant of a monovalent ion and is included in phosphor by approximately 0  $\leq$  d  $\leq$  1000 wt-ppm. Dopant M of a monovalent ion is at least one type of element selected from a group of K, Na, Li, Cu, Ag and Au.
